

BlackBerry Internet

Blackberry from Fluidata is a complete wireless communications solution that simplifies access to mobile email, calendar and contact information, while still functioning as a mobile phone. The service is 'always-on' with real-time 'push' email technology, meaning emails are automatically sent to your BlackBerry device instantly without user intervention required.

Using BlackBerry Enterprise Server software, the system is intelligently integrated into your company's email system, giving you a mobile extension to your mailbox: effortlessly read, compose, forward, reply, file or delete messages on the move. You can also view attachments in formats such as Microsoft Word, Excel, PowerPoint or Adobe PDF. An optimised keyboard is included, thumb-operated navigation wheel, easy-to-read backlit screen, intuitive menu-driven interface and integrated software applications.

The BlackBerry also incorporates password protection, a keyboard lock, and end-to-end triple DES encryption implemented on all BlackBerry Enterprise data traffic with an option to upgrade to Advanced Encryption Standard (AES). The Enterprise software can be installed alongside Microsoft Exchange and IBM Lotus Domino services, providing users with additional security, and IT departments with simplified management and centralised control.

Version 4.0 is the latest software release that lets users manage their personal information remotely, and enables IT managers to wirelessly provision users, cutting rollout costs. Be aware that this product is highly addictive; it is affectionately known by its users as the Crack-Berry!
