

Software Engineer

UK-London-Paddington Area

Company Summary: Fast-growing business internet service provider (ISP) centred on four key values: affordable services, exploiting technical innovation, offering excellent customer care and 24/7 support. Specialising in low contention, high speed services we currently supply a wide range of internet services to businesses from SME to FTSE100.

Position: A Software Engineer with proficiencies in Linux, C++, C, Java and HTML is required to work on an exciting and new exclusive software solution providing visual collaboration over the internet. The software has to date been designed to work on dedicated hardware within a client's network, so that employees can upload documents and diagrams to work on using tablets.

This software supports web based interaction but needs further development from an experienced engineer to turn it into a completely hosted solution so that any customer could use the software remotely through their web browser without the need to purchase hardware.

This project is short-term with long-term potential. Initially the software needs some very definite changes; however ongoing work and a team leader will be required when the program is launched on the open market to develop the software further.

The successful candidate would possess good time management skills and be used to working to specified deadlines.

Relevant Work Experience: Linux, C++, C, Java and HTML coding experience

Career Level: Technical

Education Level: Industry qualifications advantageous

Job Type: Permanent or Part-Time

Salary: In line with industry expectations
