

PureFluid BURST

PureFluid BURST is an aggregated SDSL/BURST solution which uses exclusive technology developed over the last 3 years. It takes our established PureFluid technology to the next level. This solution delivers the benefits of excellent upload speeds, coupled with a tremendous download capability.

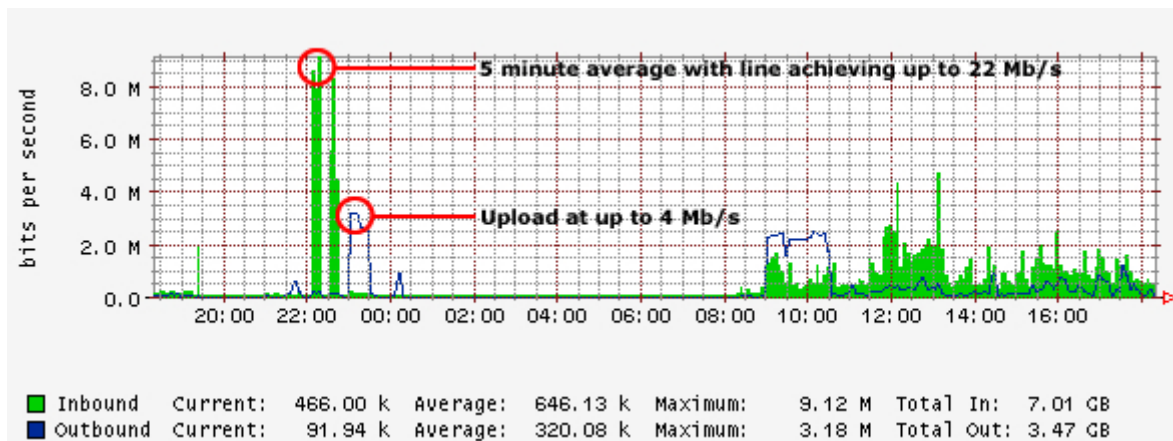

SDSL Leased Lines and BURST connections are used to deliver the service. These connect to a specially developed server and our unique technology carries out advanced packet distribution across the lines at IP level. The result is a single large Internet pipe with fully bonded circuits on both the upload and download traffic.

The PureFluid BURST service is presented to your network via a single Ethernet connection with a single static IP block applied to the overall service. This allows for seamless failover. If one of the composite circuits develops a fault your IP routing remains unaffected as PureFluid BURST continues using the working circuits.

The product is more cost-effective than legacy leased lines and different to our PureFluid product which is a symmetric product. The beauty of PureFluid BURST is that you can tailor make a solution to suit your business needs.

Live customer example of PureFluid BURST usage

Service

- Free RIPE static IP address allocation
- Download upto 40 Mb/s
- Upload up to 4.5 Mb/s
- 12 or 24 Month Contract

Fail-over

- PureFluid BURST features automatic redundancy as standard
- Redundancy between SDSL/BURST circuits
- Redundancy between SDSL/BURST routers

Guarantees

- 99.9% service level agreement on connection uptime
- 99.9% service level agreement on network availability
- Different guarantees relate to the BURST service

Support

- On-site installation
- 24/7 technical support
- Live web-based service statistics
