

Still paying over the odds for your low bandwidth leased line?

For years businesses requiring dedicated internet connections had no choice but to use legacy leased lines or ISDN. Many are still using these services, paying thousands of pounds each year for lines capable of only 64 or 128 Kb/s. Yet there are now plenty of cheaper, faster and equally as reliable services available.

Fluidata, the leading provider of broadband leased lines, specialises in low cost dedicated services, exploiting the full potential of high bandwidth DSL technologies. For example, Fluidata offers an ADSL Leased Line service, with guaranteed bandwidth and SLAs from only £115 per month. This service is available through all broadband enabled exchanges nationwide, offering a genuine cost-effective alternative to services previously only possible using ISDN or legacy leased lines.

Fluidata's low cost leased line service is based on ADSL technology, but unlike conventional broadband the service is guaranteed, with a 1:1 contention ratio made possible using a Virtual Path at the exchange: a dedicated tunnel to the internet. The service also uses business care cover for the line, so that a 99.9% SLA can be offered, ensuring maximum availability.

As well as cost savings businesses benefit from increased bandwidth, with the 512Kb/s service operating at 256Kb/s upload and 512Kb/s download. The service is also extremely simple to install, requiring only a standard BT phone line. Fluidata can provide pre-configured routing hardware, and all services come with a static IP allocation and 24 hour support.

With options such as Fluidata's ADSL Leased Line, available nationwide, there is no longer any reason for businesses to keep paying out for old legacy services; they could be enjoying up to four times the speed at a fraction of the cost.
