

Fluidata launches Leased Line internet service with fail-over across multiple providers

Fluidata's class leading Leased Line service, PureFluid, is now available across the UK using multiple Tier-1 carriers to increase reliability and redundancy. For the first time businesses can have an internet connection from a leading business ISP which combines connectivity from two or more independent telecom carriers to provide a single fast and reliable connection for their company.

PureFluid is a unique technology that can bond leading internet service providers together creating a single larger internet connection. This means that Fluidata's customers receive increased reliability and fail-over between the underlying providers, and benefit from faster data transfer rates.

PureFluid can also mix together different technologies creating unique solutions. For example, Fluidata is able to bond together SDSL and ADSL2+, to create a unique product that has the low contention and guaranteed reliability of the SDSL as well as the faster download speeds of the ADSL2+.

In this way PureFluid is an all-in-one business focused service, delivering reliable and bespoke internet connectivity into corporate networks through a single cable.

By choosing PureFluid businesses are able to benefit from the cost savings and faster data transfer rates from new technologies, such as ADSL2+. At the same time PureFluid increases reliability by having two or more Tier-1 providers delivering the overall service.
